KEY FIGURES

PRELIMINARY DATA

	Population at end Jun qtr 2007 '000	Change over previous year '000	Change over previous year %
New South Wales	6 889.1	71.9	1.1
Victoria	5 205.2	76.9	1.5
Queensland	4 182.1	90.5	2.2
South Australia	1 584.5	16.3	1.0
Western Australia	2 105.8	46.7	2.3
Tasmania	493.3	3.4	0.7
Northern Territory	215.0	4.3	2.0
Australian Capital Territory	339.9	5.6	1.7
Australia(a)	21 017.2	315.7	1.5

(a) Includes Other Territories comprising Jervis Bay Territory, Christmas Island and the Cocos (Keeling) Islands.

KEY POINTS

ESTIMATED RESIDENT POPULATION

- The preliminary estimated resident population (ERP) of Australia at 30 June 2007 was 21,017,200 persons. This was an increase of 315,700 persons (1.5%) since 30 June 2006 and 68,300 persons since 31 March 2007.
- The preliminary natural increase recorded for the year ended 30 June 2007 (138,100) was 6.7% (or 8,700 persons) higher than the natural increase recorded for the year ended 30 June 2006 (129,400).
- Preliminary net overseas migration for the year ended 30 June 2007 was 177,600 persons.

POPULATION GROWTH RATES

- The Australian population grew by 1.5% during the 12 months ended 30 June 2007. Natural increase and net overseas migration contributed 44% and 56% respectively to this total population growth.
- All states and territories experienced positive population growth over the 12 months ended 30 June 2007. Western Australia recorded the largest percentage gain (2.3%) and Tasmania the smallest (0.7%).

NOTES

FORTHCOMING ISSUES	ISSUE (Quarter)	RELEASE DATE
	September 2007	19 March 2008
	December 2007	5 June 2008
	March 2008	24 September 2008
	June 2008	2 December 2008
	September 2008	18 March 2009

ERP DATA STATUS

The majority of population data for September quarter 2001 onwards in this publication are based on the 2006 Census. This publication contains final, revised and preliminary data. For the current status refer to the table *Status of Quarterly ERP Data* at paragraph 7 of the Explanatory Notes.

CHANGES IN THIS ISSUE

Changes included in this issue are as follows:

- An international comparisons table of population, growth rate and rank has been included in the Main Features;
 - Preliminary total fertility rates (TFRs) for 2006–07 are published in table 13;
 - Preliminary standardised death rates (SDRs) for 2006–07 are published in table 14;
 - Preliminary infant mortality rates (IMRs) for 2006–07 are published in table 15;
 - Population estimates for Capital City Statistical Divisions and selected Statistical Districts for 1996, 2001 and 2006 have been replaced with estimates for 2001, 2005 and 2006. See table 5;
 - Population estimates for Australian External Territories in table 8 have been updated to 30 June 2007;
 - Experimental estimates of the Australian Indigenous and non-Indigenous populations in tables 11 and 12 include a total for ages 75 and over;
 - Projected number of households in table 20 and projected population in households and projected household size in table 21 include projections for 2007, 2008, 2009 and 2010; and
 - The *Technical Note Measuring Net Overseas Migration, Method used September quarter 2001 to June quarter 2006* has been removed.

UPCOMING RELEASES

Population by Age and Sex, Australian States and Territories, June 2007

(cat. no. 3201.0) will be released on 12 December 2007. This issue will contain estimated resident population (ERP) by age and sex based on the 2006 Census.

Brian Pink Australian Statistician

MAIN FEATURES

AUSTRALIA: POPULATION AND GROWTH

The preliminary estimated resident population (ERP) of Australia at 30 June 2007 was 21,017,200 persons, an increase of 315,700 since 30 June 2006 and 68,300 persons since 31 March 2007. The increase for the year ended 30 June 2007 is the highest recorded for a 12 month period since the ERP concept was introduced in 1971 (see paragraphs 4 to 6 of the Explanatory Notes for more detail).

The annual population growth rate for the year ended 30 June 2007 at 1.53% was the highest annual growth rate for a year ended 30 June since 1989.

PRELIMINARY DATA

Due to the collection and estimation methods applied to produce preliminary statistics from the components of population change, users should exercise caution when analysing and interpreting the most recent quarterly estimates.

COMPONENTS OF POPULATION CHANGE

Natural Increase

The growth of Australia's population has two components: natural increase (the number of births minus the number of deaths) and net overseas migration (net permanent and long-term movement).

Natural increase for the 12 months ended 30 June 2007 was 138,100 persons, an increase of 6.7% (or 8,700 persons) on the natural increase for the year ended 30 June 2006 (129,400 persons).

BIRTHS

The preliminary estimate for births (272,900) during the year ended 30 June 2007 was 3.6% higher than the figure for the year ended 30 June 2006 (263,400). Births in the year ended 30 June 2007 was the highest ever recorded for years ending 30 June.

The total fertility rate (TFR) for the year ended 30 June 2007 was 1.853 which is the highest recorded since the year ended 30 June 1993.

DEATHS

The preliminary estimate for deaths during the year ended 30 June 2007 (134,800) was the highest ever recorded for a year ending 30 June.

The standardised death rate (SDR) for the year ended 30 June 2007 was 5.93 which is the lowest ever recorded. The infant mortality rate (IMR) for the year ended 30 June 2007 was 4.62 which is also the lowest ever recorded.

Net Overseas Migration

For the year ended 30 June 2007, Australia recorded a preliminary net overseas migration (NOM) estimate of 177,600 persons. This increase accounted for 56% of the total population increase in the year ended 30 June 2007.

AN IMPROVED METHOD FOR CALCULATING NOM

The ABS has introduced an improved method for estimating NOM. This method has been used for September quarter 2006 onwards. Preliminary NOM estimates are based on international movement data for the reference quarter, adjusted by information derived from travellers with the same characteristics from the corresponding quarter two years earlier. Final NOM estimates for the four quarters of 2006-07 (scheduled for release in March 2009) will be based on the actual duration of stay in Australia and overseas of international travellers.

MAIN FEATURES *continued*

Net Overseas Migration continued

The time series using the previous method for calculating NOM finishes at June quarter 2006. Estimates from this past time series and the current time series are not comparable. For further information see *Information Paper: Improved Methods for Estimating Net Overseas Migration* (cat. no. 3107.0.55.003); *Information Paper: Statistical Implications of Improved Methods for Estimating Net Overseas Migration, Australia 2007* (cat. no. 3107.0.55.005); and the *Technical Note Measuring Net Overseas Migration, Method Used September Quarter 2001 to June Quarter 2006* in the March quarter 2007 issue of this publication (cat. no. 3101.0).

STATES AND TERRITORIES: POPULATION AND GROWTH

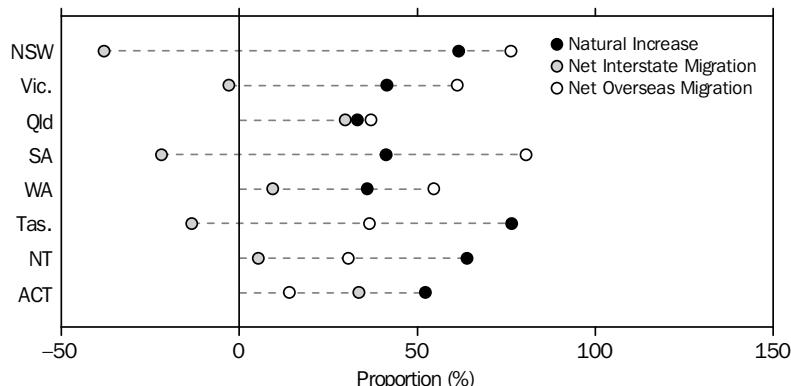

The estimated resident populations for the states and territories at 30 June 2007 were as follows: New South Wales 6,889,000, Victoria 5,205,000, Queensland 4,182,000, South Australia 1,585,000, Western Australia 2,106,000, Tasmania 493,300, the Northern Territory 215,000, and the Australian Capital Territory 339,900. All states and territories recorded positive population growth over the 12 months ended 30 June 2007. Western Australia recorded the fastest growth rate (2.3%), followed by Queensland (2.2%), the Northern Territory (2.0%), the Australian Capital Territory (1.7%), Victoria (1.5%), New South Wales (1.1%), South Australia (1.0%) and Tasmania (0.7%).

COMPONENTS OF POPULATION CHANGE

At the state and territory level, population growth has three components: natural increase, net overseas migration and net interstate migration.

Although all states and territories experienced positive population growth in the year ended 30 June 2007, the proportion that each of these components contributed to population growth varied between the states and territories.

POPULATION COMPONENTS, Proportion of total growth(a)—Year ended 30 June 2007

(a) Each population component as a proportion of a state's or territory's population growth for the year ended 30 June 2007.

Natural Increase

As illustrated in the graph above, natural increase was the major component of population growth in Tasmania at 76.6% (2,600 persons), the Northern Territory at 64.0% (2,800 persons) and the Australian Capital Territory at 52.3% (2,900 persons) for the year ended 30 June 2007.

MAIN FEATURES *continued*

Natural Increase continued

BIRTHS

The number of births registered for the 12 months ended 30 June 2007 showed an increase in birth registrations in all states, with Western Australia recording the largest increase of 6.3%.

DEATHS

Deaths registered for the year ended 30 June 2007 showed South Australia and New South Wales both experienced annual decreases of 1.2% and 0.4% respectively. All other states and territories recorded an increase in death registrations, with Victoria recording the largest increase of 2.6%.

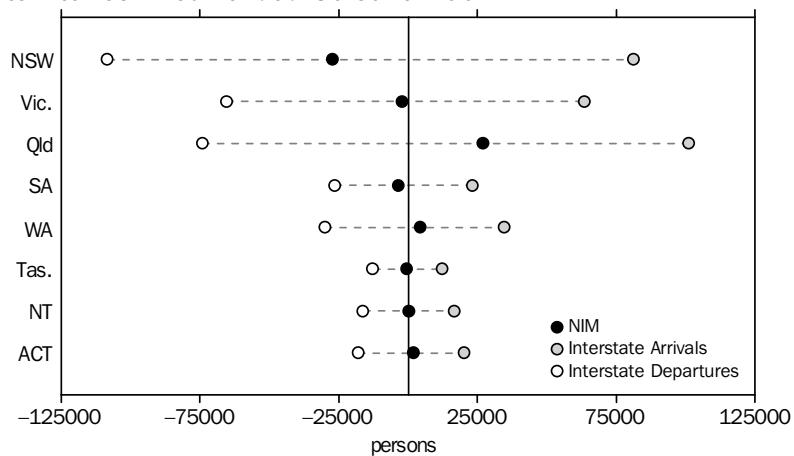

Net Overseas Migration

Net overseas migration for the year ended 30 June 2007, as illustrated in the previous graph, was the major component of population growth in South Australia at 80.6% (13,100 persons), New South Wales at 76.4% (54,900 persons), Victoria at 61.3% (47,200 persons), Western Australia at 54.6% (25,500 persons) and Queensland at 37.0% (33,500 persons). All other states and territories experienced positive NOM.

Net Interstate Migration

Estimates of quarterly interstate migration showed there were 351,900 persons moving interstate within Australia for the year ended 30 June 2007. Queensland, the Australian Capital Territory and Western Australia recorded larger increases from net interstate migration when compared to the previous year ended 30 June. New South Wales, South Australia, Victoria and Tasmania experienced a larger loss from net interstate migration. Over the same period, the Northern Territory changed from negative to positive net interstate migration.

INTERSTATE MIGRATION, Arrivals, Departures and Net—States and territories—Year ended 30 June 2007

As illustrated in the graph above, Queensland experienced the highest positive net interstate migration with a gain of 27,000 persons for the year ended 30 June 2007. Other states and territories to experience a positive net interstate migration were Western Australia (4,400 persons) the Australian Capital Territory (1,900 persons) and the Northern Territory (230 persons). Negative net interstate migration was experienced by New South Wales (27,300 persons), South Australia (3,600 persons), Victoria (2,200 persons) and Tasmania (450 persons).

MAIN FEATURES *continued*

.....

INTERNATIONAL COMPARISON

For the 12 months ended 30 June 2007, Australia's population growth rate (1.5%) was higher than that of the world (1.2%). Australia's growth rate was lower than that of Papua New Guinea (2.2%), Malaysia (1.8%), and India (1.6%). It was higher than Singapore (1.4%), Indonesia (1.2%), New Zealand (1.0%), Canada (0.9%), United States of America (0.9%), Thailand (0.7%), China (0.6%), Hong Kong (0.6%) and the United Kingdom (0.3%). Unlike Australia, Germany experienced no change. Further, Japan experienced a decrease in population (0.1%).

According to figures from the US Bureau of Census' International Data Bank of 224 countries, Australia's population size ranked 54th in 2007 (no change from 2006) and is projected to rank 65th in 2050. By 2050, India is projected to have displaced China to become the most populous country with close to one fifth of the world's population at 1.8 billion people.

(a) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

(b) These NOM estimates contain a break in time series. Estimates for September quarter 2006 onwards use an improved methodology and are not comparable with NOM estimates from earlier periods – see paragraph 1 of the Technical Note in the March quarter 2007 issue of this publication.

(c) Estimates of NOM for September quarter 2006 onwards are preliminary.

(a) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

(b) Differences between total growth and the sum of the components of population change prior to September quarter 2006 are due to intercensal discrepancy.

(c) Estimates of total population growth for September quarter 2006 onwards are preliminary – see Status of quarterly ERP data at paragraph 7 of the Explanatory Notes.

(a) Data are based on the 2001 Census. Uses revised ERP at 30 June 2004 as the base population. See paragraphs 28–29 of the Explanatory Notes for the levels assumed under all three series.

(b) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

(c) Series A assumes high levels of fertility, life expectancy, overseas migration and interstate migration flows.

(d) Series B assumes medium levels of fertility, life expectancy, overseas migration and interstate migration flows.

(e) Series C assumes low levels of fertility, overseas migration and interstate migration flows and a medium level of life expectancy.

- (a) Data are based on the 2001 Census.
 (b) For information on these experimental estimates and projections see paragraphs 21–22 of the Explanatory Notes.
 (c) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

- (d) The high projections series assumes a component of increase in the Indigenous population observed between the 1996 and 2001 Censuses which cannot be attributed to natural increase.
 (e) The low projections series assumes changes in the Indigenous population as a result of natural increase and interstate migration only.

- (a) See paragraphs 8–10 of the Explanatory Notes for information on using year/quarter of occurrence for revised and final data, and year/quarter of registration for preliminary data.
- (b) Includes Other Territories — see paragraph 2 of the Explanatory Notes.
- (c) Birth estimates for September quarter 2006 onwards are preliminary on a quarter of registration basis. See paragraphs 8–10 of the Explanatory Notes.
- (d) Births per woman.
- (e) Calculated using revised births on occurrence basis and revised ERP based on the 2006 Census unless otherwise stated in this table.
- (f) Calculated using preliminary births on registration basis and preliminary ERP based on the 2006 Census.

(a) See paragraphs 8–10 of the Explanatory Notes for information on using year/quarter of occurrence for revised and final data, and year/quarter of registration for preliminary data.

(b) Includes Other Territories — see paragraph 2 of the Explanatory Notes.

(c) Death estimates for September quarter 2006 onwards are preliminary on a quarter of registration basis.

(d) Based on the direct method per 1,000 persons. The standard population used is all persons in the Australian population at 30 June 2001.

(e) Calculated using revised deaths on occurrence basis and revised ERP based on the 2006 Census unless otherwise stated in this table.

(f) Calculated using preliminary deaths on registration basis and preliminary ERP based on the 2006 Census.

np not available for publication but included in totals where applicable, unless otherwise indicated

(c) Infant death estimates for September quarter 2006 onwards are preliminary on a quarter of registration basis.

(a) See paragraphs 8–10 of the Explanatory Notes for information on using year/quarter of occurrence for revised and final data, and year/quarter of registration for preliminary data.

(d) Per 1,000 live births.

(b) Includes Other Territories — see paragraph 2 of the Explanatory Notes.

(e) Calculated using revised infant deaths and revised births both on occurrence basis unless otherwise stated in this table.

(f) Calculated using preliminary infant deaths and preliminary births both on registration basis.

- (a) This time series ends at June quarter 2006 and all data is now final. NOM estimates from September quarter 2006 onwards use an improved methodology – see Table 2 for these estimates and the Technical Note in the March quarter 2007 issue of this publication for further information.
- (b) Estimates in this table include migration adjustments – see paragraphs 16–19 of the Technical Note in the March quarter 2007 issue of this publication and the Glossary entry for Migration adjustment.

- (a) This table contains movement data. Care should be taken when interpreting this movement data as 'persons'. See paragraph 23–27 of the Explanatory Notes.
- (b) Figures for short-term movement are based on a sample and are subject to sampling error. See *Overseas Arrivals and Departures, Australia* (cat. no. 3401.0) for more detail.
- (c) Due to rounding the total may not equal the sum of categories of the overseas arrivals.
- (d) Stated intention on arrival.

- (a) This table contains movement data. Care should be taken when interpreting this movement data as 'persons'. See paragraph 23–27 of the Explanatory Notes.
- (b) Figures for short-term movement are based on a sample and are subject to sampling error. See *Overseas Arrivals and Departures, Australia* (cat. no. 3401.0) for more detail.
- (c) Due to rounding the total may not equal the sum of categories of the overseas departures.
- (d) Stated intention on arrival.

(b) Includes Other Territories – see paragraph 2 of the Explanatory Notes.

EXPLANATORY NOTES

INTRODUCTION

1 This quarterly publication contains the most recent estimates of the resident populations (ERP) of Australia and the states and territories based on the results of the *2006 Census of Population and Housing* held on 8 August 2006 (with various adjustments described in paragraph 5). The ABS has used the 2006 Census to produce revised rebased estimates of the resident population (refer to paragraph 6). The publication contains the latest available statistics on births, deaths (including infant deaths) and overseas and interstate migration. In addition, the publication includes estimates of the resident population by age groups, major population regions and experimental estimates and projections of the Aboriginal and Torres Strait Islander population. It also includes projected resident populations, projected number of households and projected average household size. Periodically, articles on specific demographic topics will be released on the ABS web site in conjunction with this publication.

2 Following the 1992 amendments to the *Acts Interpretation Act* to include the Indian Ocean Territories of Christmas Island and the Cocos (Keeling) Islands as part of geographic Australia, population estimates commencing from September quarter 1993 include estimates for these two territories. To reflect this change, another category of the state and territory level has been created, known as Other Territories. Other Territories include Jervis Bay Territory (previously included with the Australian Capital Territory), as well as Christmas Island and the Cocos (Keeling) Islands which were previously excluded from population estimates for Australia. Data for Other and External Territories are detailed separately in Table 8.

3 Estimates for Australian External Territories will be updated annually as at 30 June unless a more recent estimate is required for electoral apportionment purposes under the *Commonwealth Electoral Act 1918*.

POPULATION AND COMPONENTS OF POPULATION CHANGE

Method of estimation

4 Australia's population estimates for the period since 1971 are compiled according to the place of usual residence of the population. An explanation of the place of usual residence conceptual basis for population estimates is given in *Demographic Estimates and Projections: Concepts, Sources and Methods* (cat. no. 3228.0).

5 The estimated resident population is an estimate of the Australian population obtained by adding to the estimated population at the beginning of each period the component of natural increase (on a usual residence basis) and the component of net overseas migration. For the states and territories, account is also taken of estimated interstate movements involving a change of usual residence. Estimates of the resident population are based on Census counts by place of usual residence, to which are added the estimated Census net undercount and the number of Australian residents estimated to have been temporarily overseas at the time of the Census. Overseas visitors in Australia are excluded from this calculation.

6 After each Census, estimates for the preceding intercensal period are revised by incorporating an additional adjustment (intercensal discrepancy) to ensure that the total intercensal increase agrees with the difference between the estimated resident populations at the two 30 June dates in the respective Census years.

Status of quarterly ERP data

7 The status of quarterly ERP data changes over time from preliminary to revised to final. The following table shows the current status of ERP and the components of population change: natural increase, net overseas migration and net interstate migration.

EXPLANATORY NOTES *continued*

STATUS OF QUARTERLY ESTIMATED RESIDENT POPULATION (ERP) DATA—as at 4 December 2007

Reference period	Census base	Natural increase	Net overseas migration	Net interstate migration	ERP STATUS
1996–2001 INTERCENSAL PERIOD					
Sep. 1996–Jun. 1997	Final rebased — based on 2001 Census	Final	Final	Final — rebased to 2001 Census	FINAL
Sep. 1997–Mar. 2001	Final rebased — based on 2001 Census	Final	Final — category jumping set to zero	Final — rebased to 2001 Census	FINAL
Jun. 2001	FINAL BASE — based on 2001 Census	FINAL
2001–2006 INTERCENSAL PERIOD					
Sep. 2001–Mar. 2006	Component revision – based on 2006 Census	Revised — based on date of occurrence	Final — includes migration adjustment using matched passenger cards	Revised on 2006 Census data — modelled - expansion factors based on 2001 Census	REVISED
Jun. 2006	PRELIMINARY BASE — based on 2006 Census	PRELIMINARY
2006–2011 INTERCENSAL PERIOD					
Sep. 2006–Jun. 2007	Preliminary estimate — based on 2006 Census	Preliminary — based on date of registration	Preliminary — improved method of NOM introduced and used for Sep. quarter 2006 onwards. Preliminary NOM estimates are based on international movement data for the reference quarter, adjusted by information derived from travellers with the same characteristics from the corresponding quarter two years earlier.	Preliminary — modelled - expansion factors based on 2001 Census	PRELIMINARY

.. not applicable

Natural increase: births and deaths

8 Natural increase is a major component of ABS quarterly state and territory population estimates and is calculated using the estimated number of births and deaths. The births and deaths data in this release are shown by state and territory of usual residence, using year/quarter of registration for preliminary data and year/quarter of occurrence for both revised and final data. This may affect time series comparisons within relevant tables. For preliminary estimates, births and deaths by quarter of registration are used as a proxy for quarter of occurrence. For revised estimates, a factor has been applied to the number of occurrences to allow for those occurrences which were yet to be registered at the time of revision. For final estimates between 30 June 1991 and 30 June 2001, year/quarter of occurrence data are used. For further details see *Demography Working Paper 1998/2 – Quarterly Birth and Death Estimates* (cat. no. 3114.0).

9 The timeliness and accuracy of ABS quarterly population estimates depends in part on the timeliness and accuracy of estimates of births and deaths which are based on registrations. To be able to provide timely estimates the ABS produces preliminary estimates using births and deaths by quarter of registration as a proxy for quarter of occurrence. The major difficulty in this area stems from the fact that while the vast majority of births and deaths are registered promptly, a small proportion of registrations are delayed for months or even years. Lags or accumulations in births and deaths registrations can be caused by either:

- late notification of a birth or death event to a state or territory registry;

EXPLANATORY NOTES *continued*

Natural increase: births and deaths *continued*

- delays arising from incomplete information supplied for a registration;
- procedural changes affecting the processing cycles in any of the state and territory registries; and
- resolution of issues that may arise within the ABS or registry processing systems.

10 Preliminary births and deaths estimates are subject to fluctuations caused by lags or accumulations in the reporting of births and deaths registrations. Accumulations can result from the eventual processing of lagged registrations in a later quarter. As a result, preliminary quarterly estimates can be an underestimate or an overestimate of the true numbers of births and deaths occurring in a reference period. Note that estimates from September quarter 2006 onwards are preliminary.

Births and deaths data adjustment

11 Adjustments were applied to December quarter 2006 births and deaths registrations in the December quarter 2006 issue of this publication to produce an accurate estimated resident population at 31 December 2006. These adjustments included the numbers of births and deaths registered over the three previous 2006 quarters (March, June and September). Adjustments applied to December quarter 2006 births and deaths registrations have been updated and are now shown in their correct quarters.

12 Further, in the March quarter 2007 issue the scheduled annual revisions for each quarter of the 2005-06 financial year were undertaken, revising all births and deaths (based on occurrence) for this time period. Preliminary births and deaths (based on registration) for September and December quarters 2006, were also updated as mentioned in the paragraph above.

Net overseas migration

13 Conceptually, net overseas migration (NOM) is the difference between permanent and long-term arrivals, and permanent and long-term departures. Estimates of NOM are derived from information provided on incoming and outgoing passenger cards, as well as other data supplied by the Department of Immigration and Citizenship (DIAC), formerly the Department of Immigration and Multicultural Affairs (DIMA) and the Department of Immigration and Multicultural and Indigenous Affairs (DIMIA). Data on the intended duration of stay of overseas visitors arriving in Australia and the intended duration of absence of Australian residents travelling overseas are used to initially determine the numbers of permanent and long-term arrivals, and permanent and long-term departures. Passenger card data are then used to calculate migration adjustments and determine the state and territory distribution of NOM.

14 The Australian Bureau of Statistics (ABS) has developed an improved method for calculating NOM for September quarter 2006 onwards. Estimates from the past time series based on the previous method, and the current time series based on the improved method are not comparable. Preliminary estimates for September quarter 2006 onwards based on the new method are included in Table 2 of this issue. The key change is the introduction of a '12/16 month rule' for determining a person's residency in Australia, replacing the previous '12/12 month rule'. For further information on the new improved method see *Information Paper: Improved Methods for Estimating Net Overseas Migration* (cat. no. 3107.0.55.003) and *Information Paper: Statistical Implications of Improved Methods for Estimating Net Overseas Migration, Australia 2007* (cat. no. 3107.0.55.005).

15 The previous method used to estimate net overseas migration from September quarter 2001 to June quarter 2006 compared data on actual travel movements over a one year period with those advised by individual travellers, and are explained in more detail in *Demography Working Paper 2003/5 - Net Overseas Migration: Adjusting for Actual Duration of Stay or Absence* (cat. no. 3137.0). In order to conduct such a comparison, data for a 15 month period (i.e. one year plus one quarter) were required.

EXPLANATORY NOTES *continued*

Net interstate migration

16 Interstate migration is a key determinant of the accuracy of state and territory population estimates. Data on interstate migration can not be directly estimated. Instead, post-censal estimates of interstate migration are modelled using administrative by-product data. Currently the data used by the ABS is information on interstate changes of address advised to Medicare Australia and to the Department of Defence in the case of the military. The Medicare-based model used for generating post-censal estimates of interstate migration is largely superseded when new Census information becomes available.

17 When Census data on interstate movement becomes available part of the process of rebasing ERPs for states and territories is the re-derivation of interstate migration for the intercensal period. The overall approach is to minimise state intercensal error using data analysed from the Census questions concerning an individual's place of residence one-year ago, five-years ago and at Census night. When new Census data are available, interstate migration estimates for the intercensal period are replaced with estimates derived from Census data on place of usual residence five years ago. These estimates are then scaled so that they sum to zero at the Australian level. A similar process is carried out for the year prior to the Census, using Census data on place of usual residence one year ago. The difference between the original interstate migration estimates and the rebased estimates is apportioned across all quarters, movement categories, ages and sex categories in the intercensal period in order to minimise quarterly change.

18 Due to the non-compulsory and non-universal nature of the available (indirect) data sources, post-censal quarterly estimates of interstate migration have long been considered the weakest measure of a component of population change. For further information on the process of estimating interstate migration and the administrative data used, see the *Demography Working Paper: 2004/1 Review of Interstate Migration Method* (cat. no. 3106.0.55.001) and the *Information Paper: Evaluation of Administrative Data Sources for Use in Quarterly Estimation of Interstate Migration, 2006 to 2011* (cat. no. 3127.0.55.001).

Defence force adjustment

19 Medicare theoretically covers all Australian usual residents as well as those non-Australian residents granted temporary registration. However, there are a range of Australian usual residents who do not access the Medicare system, primarily due to access to alternative health services. One group is the military. As such, estimates of interstate migration produced from the interstate migration model described in the working paper *Demography Working Paper: 2004/1 Review of Interstate Migration Method* (cat. no. 3106.0.55.001) are adjusted to compensate for defence force movements not covered by Medicare. These adjustments are estimated using counts of defence force personnel by age, sex and state/territory, obtained from the Department of Defence, with 70% of any change in quarterly defence numbers assumed to be due to interstate migration not otherwise covered by the model.

RATES OF POPULATION GROWTH

20 The average annual growth rate, r , is calculated as a percentage using the formula

$$r = \left[\left(\frac{P_n}{P_o} \right)^{\frac{1}{n}} - 1 \right] \times 100$$

where P_0 is the population at the start of the period, P_n is the population at the end of the period and n is the length of the period between P_n and P_0 in years.

DEPARTURES STATISTICS

Scope

21 Estimates of the Indigenous population are experimental in that the standard approach to population estimation is not possible because satisfactory data on births, deaths and internal migration are not generally available. Furthermore, there is significant intercensal volatility in census counts of the Indigenous population, thus adding to the problem of estimating the true Indigenous population. This volatility can in part be attributed to changes to the Indigenous population that can not be attributed to natural increase or interstate migration. As a result, a method based on the use of life tables is used to produce time series data. For further details see *Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians* (cat. no. 3238.0).

22 Experimental estimates of the Indigenous population as at 30 June 2001 are used as the base population for projections of the Indigenous population to 30 June 2009. A low and a high projection series have been generated, and respectively imply a low and high overall growth rate of the Indigenous population. The low series assumes a change to the Indigenous population is a result of natural increase and, for states and territories, a result of interstate migration. The high series assumes an increase in the Indigenous population observed between the 1996 and 2001 Censuses which cannot be attributed to natural increase. For further details see *Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 1991–2009* (cat. no. 3238.0).

23 Persons arriving in, or departing from Australia provide information in the form of incoming and outgoing passenger cards. Incoming persons also provide information in visa applications, apart from people travelling as Australian and New Zealand citizens. These and other information available to the Department of Immigration and Citizenship (DIAC) serve as a source for statistics of overseas arrivals and departures (OAD).

24 In July 1998, DIAC revised the incoming and outgoing passenger cards and associated procedures as well as computer systems. Some questions which obtained information already stored in the DIAC Travel and Immigration Processing System (TRIPS) (e.g. sex and marital status) were deleted. Data for the deleted questions and some other missing data (for unanswered questions or missing data) is obtained from the DIAC TRIPS. The changes also affect the data for 'previous country of residence' which is imputed for Australian and New Zealand citizens. For more information see the May 1998 issue of *Overseas Arrivals and Departures, Australia* (cat. no. 3401.0). Since July 1998, there have been additional minor changes to both incoming and outgoing passenger cards.

25 From July 2001, DIAC adopted a new passenger card processing system which involved electronic imaging of passenger cards and intelligent character recognition of the data stored in the images. This process has yielded several improvements to the processing of passenger card data, most notably the detailed information about missing values. There have also been several changes to data quality. Further information on these changes is provided in *Overseas Arrivals and Departures, Australia* (cat. no. 3401.0).

26 Overseas arrivals and departures statistics relate to the number of movements of travellers rather than the number of travellers (i.e. multiple movements of individual persons during a given reference period are each counted separately). The statistics exclude the movements of operational air and ships' crew, of transit passengers who pass through Australia but are not cleared for entry, and of passengers on pleasure cruises commencing and finishing in Australia. Similarly, these statistics exclude unauthorised arrivals.

27 For more information on overseas arrivals and departures see *Overseas Arrivals and Departures, Australia* (cat. no. 3401.0).

EXPLANATORY NOTES *continued*

POPULATION PROJECTIONS

28 Population projections presented in this publication are not predictions or forecasts. They are an assessment of what would happen to Australia's population if the assumed levels of components of population change – births, deaths and migration – were to hold for the next 50–100 years.

29 The ERP at June 2004 is the base for the projections series. The three series presented in this publication, and their assumptions are as follows:

- Series A (high series) — assumes the TFR will reach 1.9 babies per woman by 2018 and then remain constant, life expectancy at birth will continue to increase until 2050–51 (reaching 92.7 years for males and 95.1 years for females), NOM will reach 140,000 by 2007–08 and then remain constant, and high flows of interstate migration.
 - Series B (medium series) — assumes the TFR will decrease to 1.7 babies per woman by 2018 and then remain constant, life expectancy at birth will continue to increase each year until 2050–51, though at a declining rate (reaching 84.9 years for males and 88.0 years for females), NOM will be held constant at 110,000 per year throughout the projection period, and medium flows of interstate migration.
 - Series C (low series) — assumes the TFR will decrease to 1.5 babies per woman by 2018 and then remain constant, life expectancy at birth will continue to increase each year until 2050–51, though at a declining rate (reaching 84.9 years for males and 88.0 years for females), NOM will reach 80,000 per year by 2007–08 and then remain constant, and low flows of interstate migration.
- For additional series and information (e.g. age, sex, states/territories and capital cities/balances of state) see *Population Projections, Australia, 2004–2101* (cat. no. 3222.0).

HOUSEHOLD PROJECTIONS

30 The ABS uses a propensity method to project numbers of households, families and living arrangements. The method identifies propensities (i.e. proportions) for people to belong to different living arrangement types from the Census of Population and Housing. Trends observed in propensities over the last four Censuses are then projected forward and applied to a projected total population see; Series II, *Population Projections, Australia, 2002 to 2101* (cat. no. 3222.0). From these projections of living arrangements, projected numbers of families and households are derived.

31 Data presented in tables 20 and 21 are not intended as predictions or forecasts, but are illustrations of growth and change in the numbers of households and average household size which would occur if the assumptions about future trends in living arrangements were to prevail over the projection period. For more information see *Household and Family Projections, Australia, 2001 to 2026* (cat. no. 3236.0).

32 During a recent investigation into the methodology used to create household estimates, it was found that the resulting series are too volatile and produce demographically implausible movements. Due to this, the ABS will continue to publish household projections instead of estimates. User consultation has shown that users prefer projections with plausible movements to estimates with implausible movements. The development of a new methodology to produce demographically plausible household estimates with less volatility is currently being undertaken.

CONFIDENTIALITY

33 The *Census and Statistics Act, 1905* provides the authority for the ABS to collect statistical information, and requires that statistical output shall not be published or disseminated in a manner that is likely to enable the identification of a particular person or organisation. This requirement means that the ABS must take care and make assurances that any statistical information about individual respondents cannot be derived from published data.

EXPLANATORY NOTES *continued*

CONFIDENTIALITY *continued*

34 Some techniques used to guard against identification or disclosure of confidential information in statistical tables are suppression of sensitive cells, and random adjustments to cells with very small values. To protect confidentiality within this publication, some cell values may have been suppressed and are not available for publication (np) but included in totals where applicable. In these cases data may not sum to totals due to the confidentialisation of individual cells.

ROUNDING

35 In this publication population estimates and their components have sometimes been rounded. Rounded figures and unrounded figures should not be assumed to be accurate to the last digit shown. Where figures have been rounded, discrepancies may occur between sums of component items and totals.

ADDITIONAL STATISTICS AVAILABLE

37 As well as the statistics included in this and related publications, the ABS may have other relevant data available on request. Inquiries should be made to the National Information and Referral Service on 1300 135 070.

38 ABS products and publications are available free of charge from the ABS website <<http://www.abs.gov.au>>. Click on Statistics to gain access to the full range of ABS statistical and reference information.

39 Statistics of overseas arrivals and departures and related data are also published regularly by DIAC (see the Department's quarterly publication, *Immigration Update*) and by the Tourism Research Australia (on international travel and tourism).

GLOSSARY

Age-specific fertility rates	Age-specific fertility rates in this publication are the number of live births (occurred or registered) during the financial year, according to age of mother, per 1,000 of the female estimated resident population of the same age at 31 December. For calculating these rates, births to mothers under 15 years are included in the 15–19 years age group, and births to mothers aged 50 years and over are included in the 45–49 years age group. Pro rata adjustment is made in respect of births for which age of mother is not given.
Average annual rate of growth	The average annual growth rate, r , is calculated as a percentage using the formula: $r = \left[\left(\frac{P_n}{P_o} \right)^{\frac{1}{n}} - 1 \right] \times 100$ where P_0 is the population at the start of the period, P_n is the population at the end of the period and n is the length of the period between P_0 and P_n in years.
Average household size	Average household size refers to the number of persons per household in private dwellings.
Balance of state or territory	The aggregation of all Statistical Divisions (SD) within a state or territory other than its capital city SD (see Major Statistical Region in <i>Statistical Geography: Volume 1—Australian Standard Geographical Classification (ASGC)</i> (cat. no. 1216.0)).
Birth	The delivery of a child, irrespective of the duration of pregnancy, who, after being born, breathes or shows any other evidence of life such as heartbeat.
Capital city	Refers to the capital city Statistical Divisions of state and territories as defined in <i>Statistical Geography: Volume 1—Australian Standard Geographical Classification (ASGC)</i> (cat. no. 1216.0).
Category of movement	Overseas arrivals and departures are classified according to length of stay (in Australia or overseas), recorded in months and days by travellers on passenger cards. There are three main categories of movement: <ul style="list-style-type: none">■ permanent movements;■ long-term movements (one year or more); and■ short-term movements (less than one year). A significant number of travellers (i.e. overseas visitors to Australia on arrival and Australian residents going abroad) state exactly 12 months or one year as their intended period of stay. Many of them stay for less than that period and on their departure from, or return to, Australia are therefore classified as short-term. Accordingly, in an attempt to maintain consistency between arrivals and departures, movements of travellers who report their actual or intended period of stay as being one year exactly are randomly allocated to long-term or short-term in proportion to the number of movements of travellers who report their actual length of stay as up to one month more, or one month less, than one year.
Census	The complete enumeration of a population or groups at a point in time with respect to well-defined characteristics (eg Population, Manufacturing, etc.). When the word is capitalised, "Census" usually refers to the national Census of Population and Housing.
Collection District (CD)	The smallest geographic area defined in the <i>Statistical Geography: Volume 1—Australian Standard Geographical Classification (ASGC)</i> (cat. no. 1216.0).
Death	Death is the permanent disappearance of all evidence of life after birth has taken place. The definition excludes deaths prior to live birth. For the purposes of the Deaths and Causes of Death collections conducted by the ABS, a death refers to any death which occurs in, or en route to Australia and is registered with a state or territory Registry of Births, Deaths and Marriages.

GLOSSARY *continued*

Estimated resident population (ERP)	The official measure of the population of Australia is based on the concept of usual residence. It refers to all people, regardless of nationality or citizenship, who usually live in Australia, with the exception of foreign diplomatic personnel and their families. It includes usual residents who are overseas for less than 12 months. It excludes overseas visitors who are in Australia for less than 12 months. Estimates of the Australian resident population are generated on a quarterly basis by adding natural increase (the excess of births over deaths) and net overseas migration (NOM) occurring during the period to the population at the beginning of each period. This is known as the cohort component method, and can be represented by the following equation: $P_{t+1} = P_t + B - D + NOM,$ where: P_t = the estimated resident population at time point t P_{t+1} = the estimated resident population at time point $t+1$ B = the number of births occurring between t and $t+1$ D = the number of deaths occurring between t and $t+1$ NOM = net overseas migration occurring between t and $t+1$. For state and territory population estimates, an additional term is added to the equation representing net interstate migration occurring between t and $t+1$, represented by the following equation: $P_{t+1} = P_t + B - D + NOM + NIM.$
Household	A household is a group of two or more related or unrelated people who usually reside in the same dwelling who regard themselves as a household and who make common provision for food or other essentials for living; or a person living in a dwelling who makes provision for his or her own food and other essentials for living, without combining with any other person. Households include group households of unrelated persons, same-sex couple households, single-parent households as well as one-person households. A household usually resides in a private dwelling (including caravans etc. in caravan parks). Persons usually resident in non-private dwellings, such as hotels, motels, boarding houses, gaols and hospitals, are not included in household estimates. This definition of a household is consistent with the definition used in the census.
Household population	The household population is the estimated resident population (ERP) that usually lives in private dwellings. It is the ERP less the population that usually lives in non-private dwellings.
Infant death	An infant death is the death of a live-born child who dies before reaching his/her first birthday.
Infant mortality rate (IMR)	The number of deaths of children under one year of age in a financial year per 1,000 live births in the same financial year.
Intercensal discrepancy	Intercensal discrepancy is the difference between two estimates at 30 June of a Census year population: the first based on the latest Census, and the second arrived at by updating the 30 June estimate of the previous Census date estimate with intercensal components of population change which take account of information available from the latest Census. It is caused by errors in the start and/or finish population estimates and/or in estimates of births, deaths or migration in the intervening period which cannot be attributed to a particular source.

GLOSSARY *continued*

Intercensal error	Intercensal error is the difference between two estimates at 30 June of a Census year population: the first based on the latest Census and the second arrived at by updating the 30 June estimate of the previous Census year with intercensal components of population change which do not take account of information available from the latest Census.
Local Government Area (LGA)	LGA is a spatial unit which represents the whole geographical area of responsibility of an incorporated Local Government Council, an Aboriginal or Island Council in Queensland, or a Community Government Council (CGC) in the Northern Territory. An LGA consists of one or more SLAs. LGAs aggregate directly to form the incorporated areas of states/territories. The creation and delimitation of LGAs is the responsibility of the state and territory Governments. The number of LGAs, their names and their boundaries vary over time. Further information concerning LGAs is contained in <i>Statistical Geography: Volume 1—Australian Standard Geographical Classification (ASGC)</i> (cat. no. 1216.0).
Long-term arrivals	Long-term arrivals comprise: <ul style="list-style-type: none">■ overseas visitors who intend to stay in Australia for 12 months or more (but not permanently); and■ Australian residents returning after an absence of 12 months or more overseas.
Long-term departures	Long-term departures comprise: <ul style="list-style-type: none">■ Australian residents who intend to stay abroad for 12 months or more (but not permanently); and■ overseas visitors departing who stayed 12 months or more in Australia.
Median age	For any distribution the median value is that which divides the relevant population into two equal parts, half falling below the value, and half exceeding it. Thus, the median age is the age at which half the population is older and half is younger.
Migration adjustment	The ABS applies a number of adjustments to overseas arrivals and departures data in order to produce estimates of net overseas migration (NOM). These mainly comprise adjustments designed to reflect differences between stated travel intentions and actual travel behaviour. Until recently, adjustments used by ABS to produce NOM estimates were collectively referred to as 'category jumping adjustments'. They are now referred to more simply as 'migration adjustments'.
Natural increase	Excess of births over deaths.
Net interstate migration	The difference between the number of persons who have changed their place of usual residence by moving into a given state or territory and the number who have changed their place of usual residence by moving out of that state or territory during a specified time period. This difference can be either positive or negative.
Net overseas migration	Net overseas migration is net permanent and long-term overseas migration, adjusted for change in traveller duration, intention and multiple movement error.
Net permanent and long-term movement	The difference between the number of permanent (settler) and long-term arrivals and the number of permanent and long-term departures. Short-term movements are excluded.
Net undercount	The difference between the actual Census count (including imputations) and an estimate of the number of people who should have been counted in the Census. This estimate is based on the PES conducted after each Census. For a category of person (e.g. based on age, sex and state of usual residence), net undercount is the resultant of Census undercount, overcount, misclassification and imputation error.
Overseas arrivals and departures (OAD)	Overseas arrivals and departures (OAD) refer to the arrival or departure of Australian residents or overseas visitors, through Australian airports (or sea ports), which have been recorded on incoming and outgoing passenger cards. Statistics on OAD relate to the number of movements of travellers rather than the number of travellers (i.e. the multiple movements of individual persons during a given reference period are all counted).

GLOSSARY *continued*

Permanent arrivals (settlers)	Permanent arrivals (settlers) comprise: <ul style="list-style-type: none">■ travellers who hold migrant visas (regardless of stated intended period of stay);■ New Zealand citizens who indicate an intention to settle; and■ those who are otherwise eligible to settle (e.g. overseas born children of Australian citizens).
	This definition of settlers is used by the Department of Immigration and Citizenship (DIAC). Prior to 1985 the definition of settlers used by the Australian Bureau of Statistics (ABS) was the stated intention of the traveller only. Numerically the effect of the change in definition is insignificant. The change was made to avoid the confusion caused by minor differences between data on settlers published separately by the ABS and the DIAC.
Permanent departures	Permanent departures are Australian residents (including former settlers) who on departure state that they are departing permanently.
Post enumeration survey	The Census Post Enumeration Survey (PES) is a household survey conducted three to four weeks after the Census. The PES allows the ABS to estimate the number of people missed in the Census and the number counted more than once. Usually more people are missed than counted more than once in Australia, leading to a net undercount. Results from the PES contribute to a more accurate calculation of the estimated resident population (ERP) for Australia and the states and territories which is then backdated to 30 June of the Census year.
Population growth	For Australia, population growth is the sum of natural increase and net overseas migration. For states and territories, population growth also includes net interstate migration. After the census, intercensal population growth also includes an allowance for intercensal discrepancy.
Population projections	The ABS uses the cohort-component method for producing population projections of Australia, the states, territories, capital cities and balances of state. This method begins with a base population for each sex by single year of age and advances it year by year, for each year in the projection period, by applying assumptions regarding future fertility, mortality and migration. The assumptions are based on demographic trends over the past decade and longer, both in Australia and overseas. The projections are not predictions or forecasts, but are simply illustrations of the change in population which would occur if the assumptions were to prevail over the projection period. A number of projections are produced by the ABS to show a range of possible future outcomes. Population projections are not predictions or forecasts. They are an assessment of what would happen, in future years, to Australia's population given a set of assumptions about future trends in fertility, mortality and migration.
Sex ratio	The sex ratio relates to the number of males per 100 females. The sex ratio is defined for the total population, at birth, at death and among age groups by appropriately selecting the numerator and the denominator of the ratio.
Short-term arrivals	Short-term arrivals comprise: <ul style="list-style-type: none">■ overseas visitors who intend to stay in Australia for less than 12 months; and■ Australian residents returning after a stay of less than 12 months overseas.
Short-term departures	Short-term departures comprise: <ul style="list-style-type: none">■ Australian residents who intend to stay abroad for less than 12 months; and■ overseas visitors departing after a stay of less than 12 months in Australia.
Standardised death rate (SDR)	Standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The ABS standard populations relate to the years ending in 1 (e.g. 1991). The current standard population is all persons in the Australian population at June 2001. SDRs are expressed per 1,000 or 100,000 persons. There are two methods of calculating SDRs:

GLOSSARY *continued*

Standardised death rate (SDR) *continued*

- The *direct method* – this is used when the populations under study are large and the age-specific death rates are reliable. It is the overall death rate that would have prevailed in the standard population if it had experienced at each age the death rates of the population under study; and
- The *indirect method* – this is used when the populations under study are small and the age-specific death rates are unreliable or not known. It is an adjustment to the crude death rate of the standard population to account for the variation between the actual number of deaths in the population under study and the number of deaths which would have occurred if the population under study had experienced the age-specific death rates of the standard population.

Wherever used, the definition adopted is indicated.

State or territory and Statistical Local Area of usual residence

State or territory and Statistical Local Area (SLA) of usual residence refers to the state or territory and SLA of usual residence of:

- the population (estimated resident population);
- the mother (birth collection); and
- the deceased (death collection).

In the case of overseas movements, state or territory of usual residence refers to the state or territory regarded by the traveller as the one in which he/she lives or has lived. State or territory of intended residence is derived from the intended address given by settlers, and by Australian residents returning after a journey abroad. Particularly in the case of the former, this information does not necessarily relate to the state or territory in which the traveller will eventually establish a permanent residence.

Statistical District (S Dist)

Statistical Districts (S Dist) consist of selected, significant, predominantly urban areas in Australia which are not located within a Capital City Statistical Division (SD). S Dists enable comparable statistics to be produced about these selected urban areas. Further information concerning S Dists is contained in *Statistical Geography: Volume 1—Australian Standard Geographical Classification (ASGC)* (cat. no. 1216.0).

Statistical Division (SD)

Statistical Divisions (SD) consist of one or more Statistical Subdivisions (SSD). These are designed to be relatively homogeneous regions characterised by identifiable social and economic units within the region, under the unifying influence of one or more major towns or cities. Information concerning SDs is contained in *Statistical Geography: Volume 1—Australian Standard Geographical Classification (ASGC)* (cat. no. 1216.0).

Statistical Local Area (SLA)

Statistical Local Areas (SLA) are, in most cases, identical with, or have been formed from a division of, whole Local Government Areas (LGA). In other cases, they represent unincorporated areas. In aggregate, SLAs cover the whole of a state or territory without gaps or overlaps. In some cases legal LGAs overlap statistical subdivision boundaries and therefore comprise two or three SLAs (Part A, Part B and, if necessary, Part C). Further information concerning SLAs is contained in *Statistical Geography: Volume 1—Australian Standard Geographical Classification (ASGC)* (cat. no. 1216.0).

Statistical Subdivision (SSD)

Statistical Subdivisions (SSD) are of intermediate size, between Statistical Local Areas (SLA) and Statistical Divisions (SD). In aggregate, they cover the whole of Australia without gaps or overlaps. They are defined as socially and economically homogeneous regions characterised by identifiable links between the inhabitants. In the non-urban areas an SSD is characterised by identifiable links between the economic units within the region, under the unifying influence of one or more major towns or cities. Further information concerning SSDs is contained in *Statistical Geography: Volume 1—Australian Standard Geographical Classification (ASGC)* (cat. no. 1216.0).

Total fertility rate (TFR)

The sum of age-specific fertility rates (live births at each age of mother per female population of that age). It represents the number of children a female would bear during her lifetime if she experienced current age-specific fertility rates at each age of her reproductive life.

Under enumeration

See net undercount.
